

# Webtography

## Clone a website via Wget

Webtography uses [Wget](#) to mirror a website and pushes it to a repository.

1. Create a GitHub token in [settings](#). Only the `public_repo` scope is needed.
2. Fill in the form below and soon after you will see the website mirrored in a new repository on your GitHub account.

### Clone a website

Website address

GitHub username

GitHub token

Branch

Notes

- Wget is instructed to only go one level down and ignore any blog directory.
  - Wget is given a maximum time of five minutes.
  - Wget is given a maximum buffer of 500 kilobytes.
  - To avoid getting rate limited by GitHub, files are created with a one second interval.
- 

**Webtography** is maintained by [webjay](#).

This page was generated by [GitHub Pages](#) using the [Cayman theme](#) by [Jason Long](#).
