rclone about

Get quota information from the remote.

Synopsis

`rclone about` prints quota information about a remote to standard output. The output is typically used, free, quota and trash contents.

E.g. Typical output from `rclone about remote:` is:

```
Total:   17G
Used:    7.444G
Free:    1.315G
Trashed: 100.000M
Other:   8.241G
```

Where the fields are:

- Total: total size available.
- Used: total size used
- Free: total space available to this user.
- Trashed: total space used by trash
- Other: total amount in other storage (e.g. Gmail, Google Photos)
- Objects: total number of objects in the storage

Not all backends print all fields. Information is not included if it is not provided by a backend. Where the value is unlimited it is omitted.

Applying a `--full` flag to the command prints the bytes in full, e.g.

```
Total:   18253611008
Used:    7993453766
Free:    1411001220
Trashed: 104857602
Other:   8849156022
```

A `--json` flag generates conveniently computer readable output, e.g.

```
{
    "total": 18253611008,
    "used": 7993453766,
    "trashed": 104857602,
    "other": 8849156022,
    "free": 1411001220
}
```

Not all backends support the `rclone about` command.

See [List of backends that do not support about](#)

```
rclone about remote: [flags]
```

Options

```
    --full   Full numbers instead of SI units
-h, --help   help for about
    --json   Format output as JSON
```

See the [global flags page](#) for global options not listed here.
